WSP USA FIELD SERVICES DISASTER AWARENESS REPORT

September 14, 2026

Severe Storm Threat

The Plains

- The soggy start to September continues across the Midwest this week, with periods of rain and strong to severe storms expected through Friday.
- Storms will bring the risk of flash flooding, with that threat increasing through midweek as additional rounds of heavy rain move across an already water-logged region.
- Damaging wind gusts will also be possible, while the threat of hail or a tornado cannot be ruled out.
- On Monday, portions of central Iowa are under a Level 3 out of 4 flash flood threat, accompanied by a broader Level 2 threat that exists across the region through Thursday.
- September has already been a remarkably wet month across parts of the Midwest. In fact, some locations are reporting their wettest start to September on record.
- More rain this week could add inches to already-soaked areas, keeping flooding concerns elevated through the week.
- A storm system moving in from the Pacific Northwest will swing into the Midwest, drawing up moisture ahead of it.
- While the low-pressure system will intensify farther north in Canada, its trailing cold front will spark the chance for a few severe storms on Monday.
- This has prompted a Level 2 out of 5 severe storm threat stretching from Wisconsin to Nebraska, with damaging wind gusts being the main concern.
- A smaller pocket of severe storms is increasingly likely around Omaha, where a Level 2 out of 5 severe storm threat has been issued.
- As the cold front moves through on Monday, the weather pattern will shift to a more active one as the system will become stationary over the region, increasing the chance of rain.
- This brings an elevated risk of flash flooding continuing through at least Thursday.
- Moisture from the Gulf of Mexico will fuel thunderstorms across the region, bringing heavy rain that could fall at rates of 1 to 2 inches per hour.
- Rainfall totals of 3 to 5 inches are becoming likely across most of Iowa and southern Minnesota, with a broader 2 to 3 inches possible from Chicago to Omaha.

WSP USA FIELD SERVICES DISASTER AWARENESS REPORT

September 14, 2026

Tropical Activity – Atlantic

Disturbance 1

- Located more than 1000 miles ESE of Bermuda.
- Conditions are currently unfavorable for development due to strong upper-level winds.
- As the system moves WNW across the central part of the Subtropical Atlantic it is forecast to enter a more conducive environment for gradual development by the middle to latter portion of this week.
- Formation chance through 48 hours: Low (near 0%); 7 days: Low (30%)

Tropical Activity – Eastern & Central Pacific

Tropical Storm Norbert

- Located 1725 miles W of southern tip of Baja California with maximum sustained winds of 40 mph.
- Moving toward the west at 13 mph and is expected to maintain this general motion during the next couple of days.
- Tropical storm-force winds extend outward up to 80 miles from the center.

Tropical Depression Fifteen-E

- Located 735 SW of the southern tip of Baja California with maximum sustained winds of 35 mph.
- Moving toward the west-southwest near 9 mph and this general motion is expected to continue for the next several days with some gradual acceleration.
- Some slight strengthening is still forecast, and the depression could become a tropical storm later today.
