WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 26, 2026

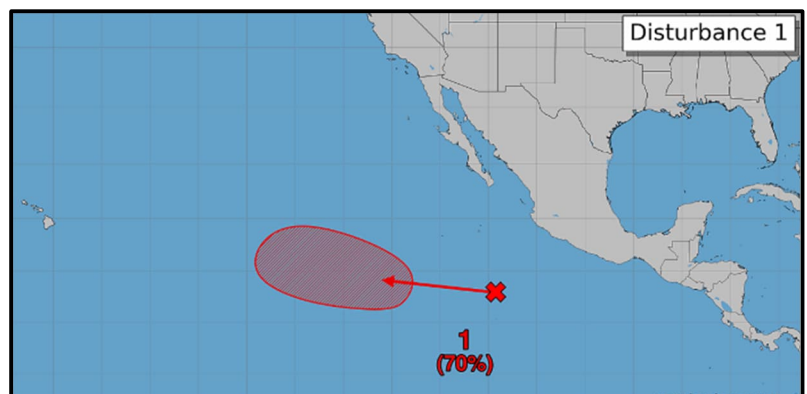

## Potential Tropical Activity Atlantic

- AccuWeather meteorologists are monitoring the southwestern Atlantic and northern Gulf for possible tropical development during the first week of July.
- The next name on the Atlantic tropical storm list for the 2026 hurricane season is Bertha.
- Clusters of thunderstorms are expected to develop along the tail end of a front that stalls near the southern Atlantic coast later this week. The storms could consolidate into an area of low pressure that, given the warm ocean waters, has a chance to become a tropical or subtropical storm.
- Any tropical system or less-organized thunderstorm cluster that moves ashore in Georgia or northern Florida would likely see development stall. However, if the low-pressure area continues to drift westward along the northern Gulf Coast, it could encounter another opportunity to strengthen.
- Multiple thunderstorm clusters may follow this westward path from the southern Atlantic coast into the Gulf. Close proximity to land and strong northeasterly wind shear would limit their chances of organizing.
- Even if none of the clusters become tropical depressions or storms, periods of heavy rain and gusty thunderstorms are likely next week from the Carolinas through Georgia and Florida to Louisiana and Texas, while areas farther north continue to swelter beneath the heat dome.

## Tropical Activity – Pacific Disturbance 1

- Located several hundred miles south of southwestern Mexico moving WNW at 10-15 mph.
- Environmental conditions are forecast for gradual development, and a tropical depression is likely to form by early to middle of next week over the central portion of the East Pacific Basin.
- Formation chance through 48 hours: Low (near 0%)
- Formation chance through 7 days: High (70%)
