WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

October 28, 2025

Tropical Activity

Hurricane Melissa (CAT 5)

- Hurricane Melissa is just hours from a historic, catastrophic Category 5 landfall in Jamaica today with life-threatening flash flooding, landslides, destructive winds and storm surge in one of the strongest landfalls on record anywhere in the Atlantic Basin.
- Currently located about 55 miles south-southeast of Negril, Jamaica, moving north-northeast at 7 mph. Hurricane force winds extending up to 30 miles from the center, that means its eyewall with most intense winds is quickly closing in on western Jamaica.
- The National Hurricane Center is warning that up to 40 inches of rain could fall in southern Hispaniola and Jamaica through Wednesday.
- That torrential rainfall is likely to trigger catastrophic, life-threatening flash flooding and landslides in Jamaica and Haiti, especially in hilly and mountainous terrain.
- In addition to the rainfall flood threat, the NHC is forecasting a storm surge of 9 to 13 feet above ground level east of where Melissa is forecast to make landfall along the southern coast of Jamaica early Tuesday.
- Melissa will likely be Jamaica's most intense hurricane landfall on record and will be the first Category 5 landfall anywhere in the Atlantic Basin since Hurricane Dorian slammed the north-western Bahamas beginning on Sept. 1, 2019.
- Melissa likely will also be among the most intense Category 5 Atlantic Basin landfalls on record.
