WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 16, 2026

Severe Storm Threat Midwest & Plains

- Severe weather will begin on Tuesday in Illinois, Indiana and Michigan, sparking thunderstorms with gusty winds and hail. However, an isolated tornado cannot be ruled out, the FOX Forecast Center said.
- The Storm Prediction Center has issued Level 2 out of 5 risk for areas in the Midwest, including the metros of Chicago, Indianapolis and Detroit.
- A strong area of low pressure is expected to develop across parts of the Plains on Tuesday and race eastward.
- Ahead of it, a strong upper-level jet stream will drive southerly winds, pulling Gulf moisture northward to interact with a cold front—setting the stage for severe weather.
- By Wednesday, the severe weather threat will increase as the area of low pressure moves from the Midwest into the Great Lakes.
- A Level 4 out of 5 severe storm threat was added Tuesday morning for areas across north-central Illinois and western Indiana.
- A Level 3 out of 5 severe storm risk has been issued from Kansas City to St. Louis, and northward into Chicago, with a broader Level 2 threat stretching from Kansas to Kentucky, including Louisville, Indianapolis, and Columbus.
- The FOX Forecast Center said there could be two distinct rounds of severe storms: One in the morning to afternoon hours bringing damaging winds and large hail, followed by a second round as atmospheric conditions rapidly destabilize by Wednesday afternoon.
- With a significant amount of wind shear in place, discrete supercells capable of producing intense, long-track tornadoes are expected to develop initially.
- Through the evening hours, these storms will develop into an intense line of severe storms bringing a widespread threat of destructive, straight-line winds through the region.
- A flash flood threat is in place across the Midwest as storms move through.
- The FOX Forecast Center said widespread rainfall totals of 1 to 2 inches are expected across Wisconsin, Illinois, Michigan, and Indiana, with localized amounts exceeding 2 to 3 inches.

WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 16, 2026

Tropical Activity – Atlantic

Disturbance 1

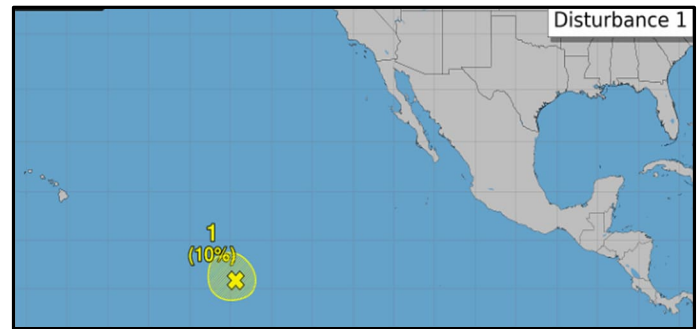

- Located inland over south Texas and is producing a large area of disorganized showers and thunderstorms.
- Forecasted to move northeastward along the Texas coast and could emerge over the north-western Gulf of America later today or tonight.
- Conditions are expected to be marginally conducive for the formation of a short-lived tropical storm late today or on Wednesday.
- Southern and Eastern Texas and portions of Louisiana and Mississippi should prepare for periods of intense rainfall over the next several days which could produce widespread, life-threatening flash, urban, and river flooding.
- Formation chance through 48 hours: Med (60%)
- Formation chance through 7 days: Med (60%)

Tropical Activity – Pacific

Disturbance 1

- Area of low pressure located well east-southeast of the Hawaiian Islands is producing disorganized showers and thunderstorms.
- Slight development of this system is still possible over the next day or so.
- Formation chance through 48 hours: Low (10%)
- Formation chance through 7 days: Low (10%)
